
Frozen example: holdout-00, phase index 337, norm 0.016, dt 0.005
A Candidate waveforms and original time origin
B Errors after each policy's one saved tail-fit phase
Original synchronous reference
Frozen hybrid
Local ± preview
Uniform 16
Augmented 21
Neuron 1 activation
Neuron 2 activation
Neuron 3 activation
Neuron 1 aligned error
Neuron 2 aligned error
Neuron 3 aligned error
Uniform16 / augmented21: identical traces here
Physical time after fixed weight change
First eligible anchor and first phase in frozen order; largest dose; all saved 0–300 samples. Gray interval: simulator preview 0–75.
Tail-fit phase uses only 75<t≤300 and stays constant over the whole error trace; each policy has its own reference shift. No frequency fitting or time warp.
The synchronous reference on the left is not the phase-aligned reference used for the error statistic.
